Outline

Working with equations

We define a set of equations as

$$a = b + c^2 \tag{1}$$

$$a - c^2 = b \tag{2}$$

$$\text{left side} = \text{right side} \tag{3}$$

$$\text{left side} + \text{something} \geq \text{right side} \tag{4}$$

for all something > 0.

Aligning the same equations

Aligning the equations by the equal sign gives a much better view into placement of the separate equation components.

$$a = b + c^2 \tag{5}$$

$$a - c^2 = b \tag{6}$$

$$\text{left side} = \text{right side} \tag{7}$$

$$\text{left side} + \text{something} \geq \text{right side} \tag{8}$$

Omit equation numbering

Alternatively, the equation numbering can be omitted.

$$a = b + c^2$$
$$a - c^2 = b$$
$$\text{left side} = \text{right side}$$
$$\text{left side} + \text{something} \geq \text{right side}$$

Ugly alignment

Some components do not look well, when aligned. Especially equations with different heights and spacing. For example,

$$E = mc^2 \tag{9}$$

$$m = \frac{m}{c^2} \tag{10}$$

$$c = \sqrt{\frac{E}{m}} \tag{11}$$

Take that into account

Discussion

This is where you'd normally give your audience a recap of you talk, where you could discuss e.g. the following

- Your main findings
- The consequences of your main findings
- Things to do
- Any other business not currently investigated, but related to your talk
